

About 1Voucher

[Hide](#)

1Voucher is a cross-border remittance and payments platform. This console is where operators configure countries, currencies, merchants, KYC tiers and the gas paymaster that powers the consumer wallet.

Key Decisions

- **Non-custodial DEX model:** Consumers buy/sell from a curated list of liquid assets by swapping their own funds on Uniswap. The platform never holds assets or takes price/hedging risk — it is not a broker or dealer.
- **USDC is the settlement currency:** All asset swaps are quoted and settled in USDC.
- **Live Uniswap pricing + platform markup:** Asset prices come live from the Uniswap V3 Quoter (per-asset fee tier), plus a per-asset platform markup in basis points. No Chainlink oracle for now — added only if/when on-chain validation is needed.
- **Safe smart wallets + passkeys:** Consumer wallets are ERC-4337 Safe accounts whose signer is a device passkey (WebAuthn / Face ID / Touch ID). No seed phrases, no MetaMask. Gas is sponsored by Pimlico.
- **Decentralised identity (idOS):** KYC credentials are issued and stored via idOS; biometric wallet recovery (FaceSign) is on the roadmap.
- **Payment tags via ENS:** Human-readable payment tags are ENS subdomains, hashed on-chain for privacy.
- **Value model: one rand balance, protocol keeps the yield:** Consumers hold a single fungible balance as Vault-ledger shares (an ERC-4626 claim) — never the treasury token directly. Behind it the protocol holds a reserve (Phase 1: 100% TTZA bank cash; later also tradeable ZAR). The spend balance is flat 1:1 and earns no yield — any vault yield accrues to the protocol. Full detail in Docs → Concepts.
- **User-signed P2P, self-custody:** Wallet-to-wallet sends are the user's own passkey-signed Vault.transfer (on-chain KYC gate: both parties verified, cross-border allowed). Gasless to the consumer — the backend relays the Safe transaction and pays gas. New Safes are ERC-4337-ready, so submission can move to a Pimlico paymaster later without re-onboarding.
- **Cross-border spend vouchers under CASP:** Cross-border value moves as an on-chain crypto-asset transfer (CASP licence), dual-KYC, settled to the merchant in fiat. Postgres is an index of on-chain events for reporting, not a second ledger. See Docs → Events & Reporting.
- **Sessions: 48h JWT, no silent refresh:** Logins last 48 hours; on expiry the user re-authenticates with their passkey. No refresh tokens.
- **Networks:** Pilot contracts run on Sepolia; mainnet is used for ENS and for DEX liquidity/pricing of listed assets.
